MAKSYM GRYNIUK

Full Stack .NET Developer

maxisoft4@gmail.com | LinkedIn | GitHub | Telegram | Website | English: B2 (Upper-Intermediate)

ABOUT

Full Stack .NET developer with around 6 years of commercial experience, mostly on data-heavy and transactional products. Significant hands-on experience with **legacy .NET Framework 4.8** codebases — supporting, extending and gradually modernising them, including breaking a monolith into .NET Core microservices and maintaining a long-running CRM project built on Code On Time. Direct experience with **payment systems: MasterCard gateway integration**, PCI DSS-compliant payment forms, SSL certificate lifecycle on Azure, and production troubleshooting through Application Insights. Comfortable across the full cycle — gathering requirements with product owners and clients, designing architecture, writing back-end and front-end, and shipping to production. Strong on software fundamentals: SOLID, design patterns, TDD, clean and maintainable code. Equally comfortable with modern .NET Core / .NET 8+ and distributed systems built on message brokers.

SKILLS

Languages & frameworks: C#, .NET Framework 4.8, ASP.NET Core (3.0–10.0), ASP.NET MVC, Blazor Server, Blazor WASM, REST APIs, Code On Time, JavaScript, TypeScript, Angular, React, jQuery, WebSockets
Legacy & modernization: long-term support of .NET Framework 4.8 codebases, monolith-to-microservices migration, gradual platform upgrades
Engineering fundamentals: SOLID, OOP, design patterns, TDD, unit / integration / E2E testing, clean architecture, DDD basics
Data: SQL Server, PostgreSQL, MongoDB, ClickHouse, CosmosDB, Elasticsearch — schema design, transactional systems, query optimisation
Messaging & distributed systems: RabbitMQ, Kafka, Azure Service Bus, NServiceBus — async service-to-service communication, background processing
Payments: MasterCard gateway integration, PCI DSS-compliant payment forms, SSL certificate management
Cloud & infra: Azure (App Service, Service Bus, Application Insights), AWS (familiar), Docker, Kubernetes (Rancher), Linux Observability: Application Insights, Kibana, Grafana, Logstash — logging, metrics, tracing CI/CD & tooling: GitHub Actions, Azure Pipelines, Jenkins, TeamCity, SonarQube

EXPERIENCE

UXRocket — FullStack .NET Engineer (Blazor)

August 2024 — present

- Designed and shipped a **Session Replay** system: user sessions reconstructed from screenshot sequences with overlays forclicks, taps and swipes, plus variable playback speed. Product teams use it to see where users get stuck and validate A/B hypotheses qualitatively, not just by the numbers.
- Built a shareable reports system with secure link-based access — replaced the old flow where reports were sent out manually. Three banking clients picked it up in the first month.
- Built dashboard components on Ant Design Charts and MudBlazor for funnel and customer-journey visualisations. Backend handles around **10M raw events per day**; charts render in under 2 seconds.
- Integrated **Active Directory SSO** for ~500 enterprise users across five banking clients.
- Wrote a bulk import/export pipeline for Excel and CSV, — batches of 100K+ records, used by compliance teams for regulatory audits.
- Built an interactive timeline component with real-time filtering over raw user events (clicks, inputs, navigation), so analysts can correlate events and drill down quickly.
- Optimised heavy data-driven screens (Blazor Server + rewrote ClickHouse queries) — slowest analytical reports went from ~8s to ~1s.

Dilyasoft — BATS CRM, Full Stack .NET Engineer (Typescript, MVC)

October 2023 — December 2024
Outstaff role — worked directly with the client (bats.rocks): gathered requirements, discussed implementation and prioritised work without intermediaries. Maintained and extended a long-running **legacy .NET Framework 4.8** CRM platform originally generated with Code On Time, gradually modernising it while keeping the production system stable.

- **Integrated MasterCard payment** gateway into the MVC application and brought the payment forms to **PCI DSS compliance**. Managed SSL certificate lifecycle for the payment SDK on Azure App Service.
- Renewed and migrated SSL certificates on Azure App Service for payment SDK integrations. Used Application Insights to investigate logs and resolve long-standing production issues.
- Integrated Userflow.js into the **legacy .NET Framework 4.8** / Code On Time app to add in-app guidance and interactive product tours. Reduced repetitive support questions about basic flows.
- Built a Telegram-integrated content platform on ASP.NET MVC + MongoDB: Telegram OAuth, user-generated content (stickers, games, channels, products). Around 2,000 active users in the first three months.
- Automated leave approvals via API integrations: Timetastic webhooks → interactive messages in RocketChat with approve/reject buttons handled via callbacks. Approvals that previously sat for a day now go through in minutes.
- Set up **CI/CD with Azure Pipelines:** build, run tests and publish to Azure App Service on push to main.

Acuitive Solutions — Full Stack .NET Engineer (Angular)

May 2022 — June 2023
https://www.acuitivesolutions.com/

- Built and maintained Angular forms in a logistics audit web app — invoices, shipment statuses, filters, complex validation. Stack: Angular + .NET Core API + SQL Server. Across three enterprise clients the system processed **12M+ shipments per month.**
- Worked on the **Rule Engine** that lets clients configure their own logistics business rules through the UI without touching code. Added new condition and action types and extended the rule editor on the front-end.
- Implemented **JWT authentication**: token issuing and validation, refresh-token flow, integration with the existing role system.
- Built a separate shipment tracking app with Google Maps: live cargo location and milestone events (departure, transfer, arrival). Cut down a significant share of the daily "where is my container" calls.
- Set up **RBAC** with granular permissions for multi-tenant access — each client sees only their own data.
- Built shareable reports with link-based access and Excel/CSV import/export.
- Moved heavy report generation and email sending to **background workers via Azure Service Bus**, so the UI stopped blocking on long operations. API response times dropped noticeably.
- Wrote the **Docker** YAML deployment pipeline for automated build and test application on Linux.

MedeAnalytics—Associate Software Engineer

February 2021 — March 2022
https://medeanalytics.com/
Worked on a large legacy .NET Framework 4.8 monolith in the healthcare analytics domain, gradually migrating parts of it to modern .NET Core services.

- Modernization: the **.NET Framework 4.8 monolith into .NET Core microservices** — improved stability and made parts of the system independently scalable. Direct fit with legacy-to-service-oriented evolution work.
- Async service-to-service communication with **RabbitMQ** and **NServiceBus**.
- Containerised services with **Docker**, deployed via Rancher (**Kubernetes**).
- Maintained **CI/CD pipelines** in **TeamCity** and **Jenkins**, with **SonarQube** for static analysis.
- Updated the **MongoDB** driver and rewrote slow queries.
- Grew the test suite from ~200 to 500+ tests (unit, integration, end-to-end), **TDD**-style.
- Set up monitoring and logging: **Kibana**, **Grafana**, **Logstash**.

iQueSoft— .NET Developer

June 2020 — February 2021
Swiss startup https://www.immosparrow.ch

- Implemented **Elasticsearch** for real-estate search — search response times improved noticeably compared to the previous SQL-based search.
- Built a high-load backend API for analytics dashboards.
- Integrated **MapBox** to show detailed property and rental info on the map.
- Added **Mustache.js** email templates for real-estate ads, which helped the marketing side collect more leads.

EDUCATION

National Aerospace University — Kharkiv Aviation Institute
Master's, Development and Management of a High-Quality Software Product, 2021–2022
Bachelor's, Intelligent Systems and Technologies, Computer Science, 2017–2021
